

It starts with us:

How I contribute to saving water.

Meet your coworker

Growing up with a spring-fed water supply, master plumber Taylor Mason learned the value of water at a young age. “We’d sometimes run out of water, so we had to pay attention to our usage.”

This awareness has helped him become a water conservation leader at the UVM Medical Center. Whether he’s installing state-of-art pumps, or helping a coworker settle a dishwasher versus hand-washing debate (the answer: it depends!), Taylor plays a key role in promoting water savings at the hospital.

How do you contribute to saving water?

From modifying patient faucets to use fewer gallons of water, to trialing low-flow flush valves in public restrooms, Taylor’s projects are, as he puts it, “All over the place!” His team has also installed water meters in various buildings to track usage and identify savings opportunities.

Though green technology can help save water, the UVM Medical Center also relies on employee support. Taylor hopes to further educate coworkers about water conservation. “Think of water as a limited resource,” he says. “We need to save clean water for future generations.”

Leading communities to a healthier future

Together, we can aide the rain.
